

Radio Frequency Asset & People Protection

# SeniorBasic<sup>®</sup>

Optimum security for patients and clients

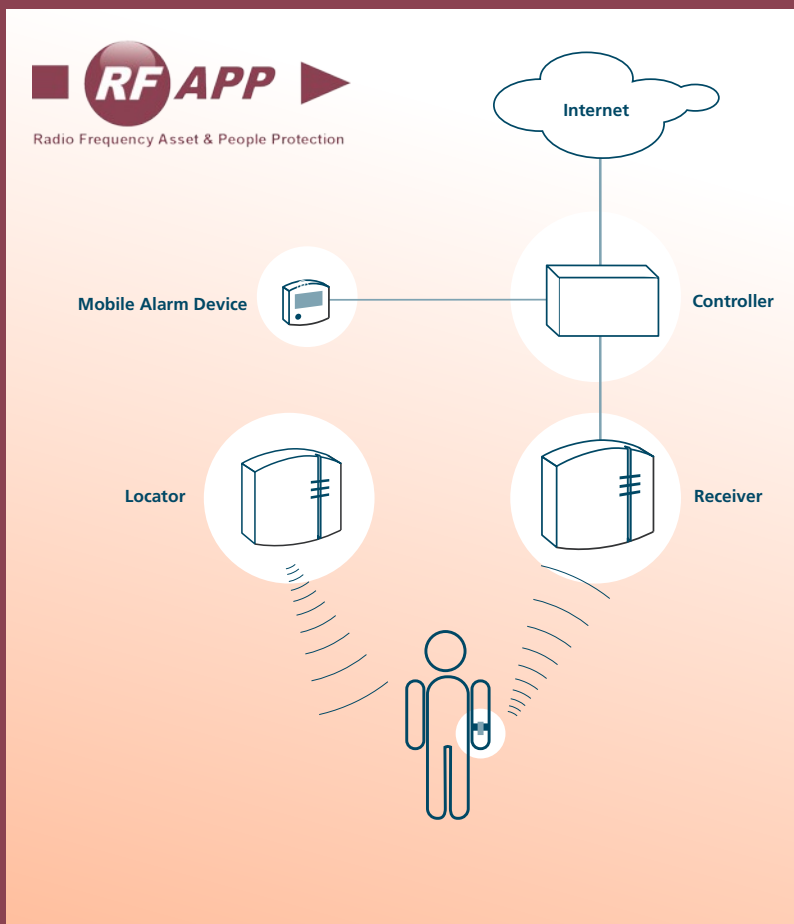

### ***“Help! Where is...?”***

*In nursing, it is very important to know where the patients can currently be found. This is not done to patronise the patients or treat them like children. It is much more about knowing that they are in a safe location. Patients could find themselves in locations which put them at risk. Naturally a greater number of ward personnel or carers could be hired. This is, however, work- and above all cost-intensive.*

***We have the solution!***

### ***Warning in good time***

*Syntron is a specialist in the protection of technical property and individuals and has allowed all of its know-how to flow into the development of SeniorBasic®. This modern, well-engineered radio-operated system guarantees that patients can move freely within zones which are safe for them. Patients who run into danger, leaving their safe area, will be detected electronically. Thus, action can be taken quickly and effectively. To this end, SeniorBasic® uses modern and reliable technology.*

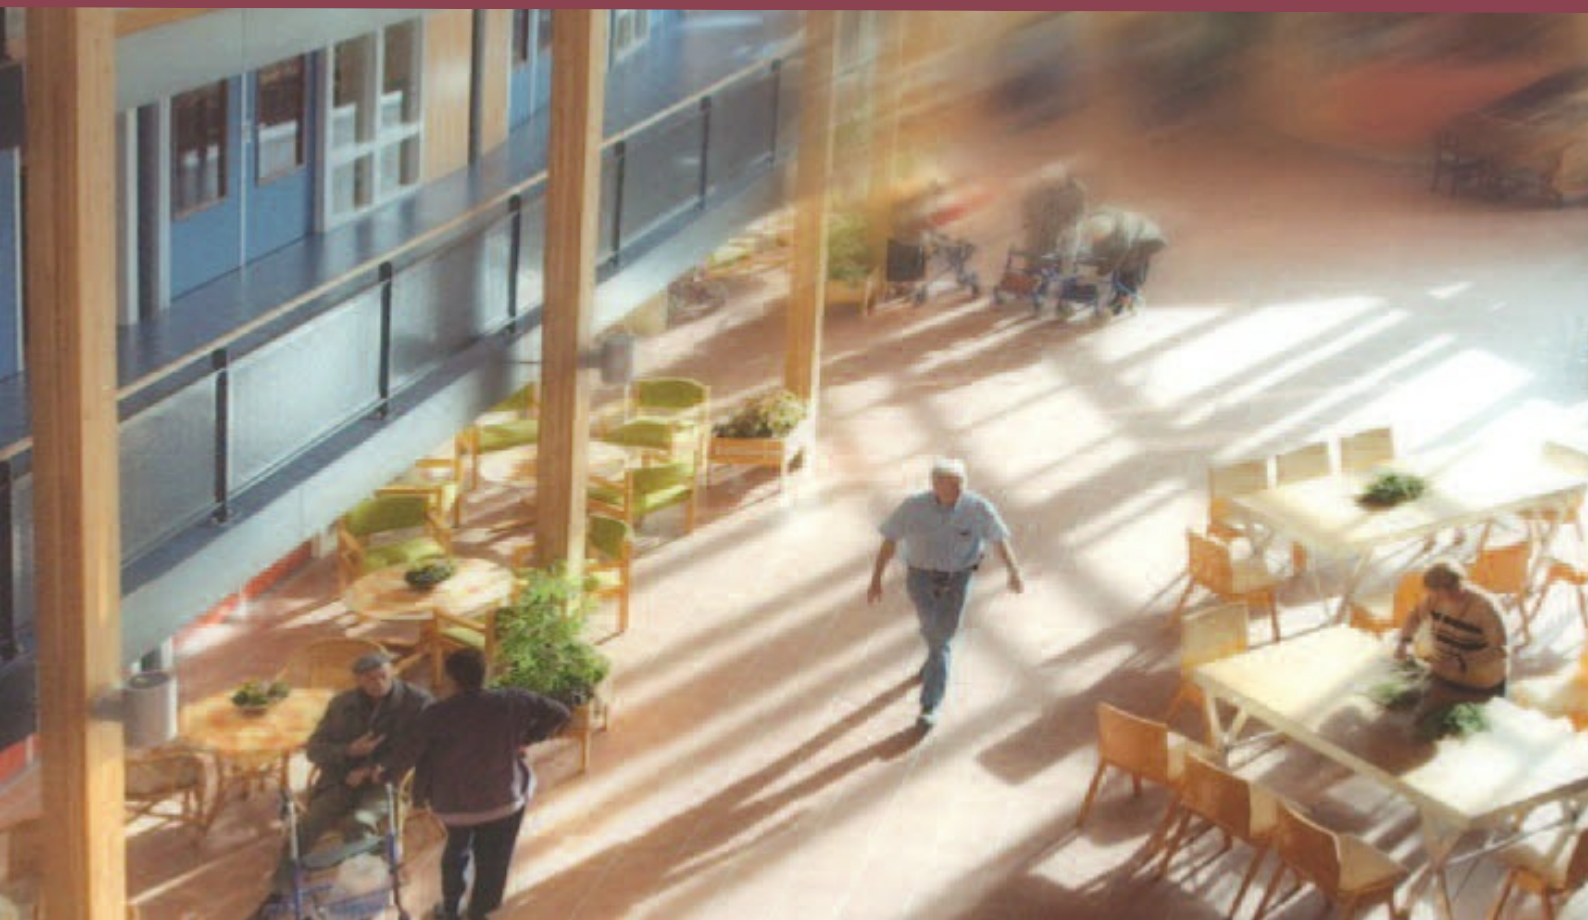

## **How does it work?**

*The patient wears a tag in the form of a watch or a clip. If the patient leaves the set of rooms appointed to them, the tag transmits a corresponding code to a receiver containing information about the patient and their location. Porters, security personnel or other responsible nursing staff receive the alarm immediately via their PC, telephone, mobile phone or pager.*

## **With respect and dignity...**

*SeniorBasic® provides you with important advantages. Patients can move around unimpeded. As soon as an alarm is reported, the nursing staff immediately know which patient is concerned and where they can be found. Action is only a matter of seconds. This combination of mobility and security makes SeniorBasic® an accepted and efficient system. Residents and patients are treated with respect and dignity.*

## **Effective and secure**

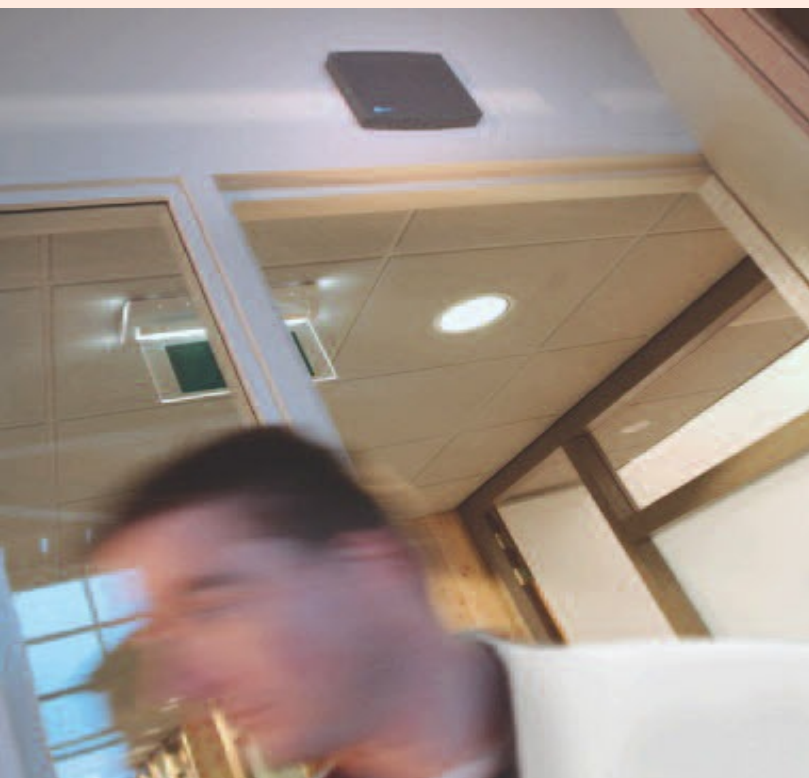

*SeniorBasic® is quick and easy to install and can be integrated into other systems, e.g. video and access control systems. The analysis of alarm events can be carried out at an "on-site workplace" or a "central office". The main task of SeniorBasic® is the precise detection of people within the area being monitored.*

*This allows quick and effective action along with the advantage of time saved for other employee tasks.*

*SeniorBasic® not only offers freedom of movement and security for patients and residents, but also allows greater efficiency in the deployment of staff.*

## **In brief**

- *SeniorBasic® is a highly developed electronic detection system*
- *Safe areas can be defined per user*
- *Personnel can be allocated to particular areas*
- *The technology can be easily installed in all buildings*
- *SeniorBasic® allows a quick and gentle response should patients go astray*
- *Alarm processing occurs immediately and effectively using only a few personnel.*
- *SeniorBasic® is a modular system. It can be added with the RFAPP systems PersonalBasic, LocalBasic and JuniorBasic®.*

## **The innovative company**

*Since its founding in 1997, Syntron has become known as an innovative company that uses modern technology to create effective and economical solutions for the protection of property and people.*

*For further information about SeniorBasic® and other protection systems, please contact us directly or get in touch with one of our partners.*

*We are here for you.*
